

Alexandra Hurst
Ky Lamoreaux

Group members that gave us feedback:

- Jordan Pyper
- Hunter Finney
- Jackson Leach

Feedback:

- Allow the male/female binary division to toggle with other binaries. Perhaps firearm type, age split, fatal/non-fatal, etc.
- Look into building a trend line chart for secondary attributes possibly instead of the binary side-by-side bar chart.
- Flush out what all will be in tooltips and how granular to get
- Maybe add more information in the map on click
- Could we factor in external factors that could've affected the trends

All group members pretty evenly distributed the above feedback.

Our analysis:

- Honestly the feedback was pretty sparsely given outside of the above points, which leads us to believe we're on the right track visualization-wise.
- We're looking into changing the male/female chart to toggle between other binaries, but most of the other binaries in our data aren't sufficiently filled out enough to warrant analyzing. What we're choosing to take away from their critique is that the male/female bar chart doesn't carry quite as much information as it could. We could remedy that by perhaps color coding the bars or adding click-able functionality or the ability to filter other parts of the visualization by gender.
- Factoring in external variables that could've affected data trends seems too tangential and outside of the scope of the project.

Quality of the feedback:

- I would have loved to get more in depth and substantial feedback, but most of what we got seemed a little trivial. Even questions like "who's the audience" or "what's the story" are useful in helping people flush out their full vision. As I look at the feedback guidelines, there are a lot of questions we didn't go over that I think could've been valuable. With the exception of re-examining our male/female visualization, I don't think there was much else to change based on feedback.
